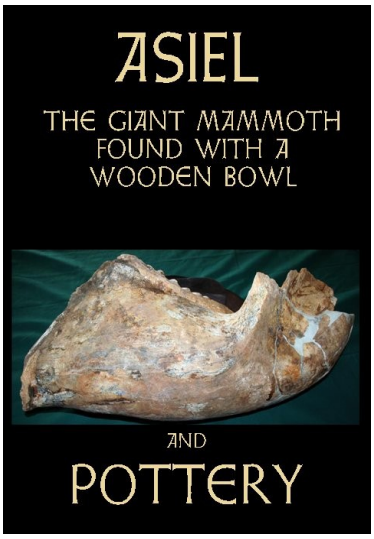
Joe Taylor

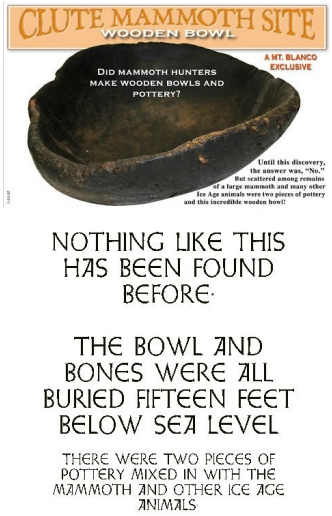
"A Mammoth Named Asiel"

Northwestern College

3003 North Snelling, Roseville Minnesota, Nazareth Hall Chapel

For Details Directions & Maps visit www.tccsa.tc





Mammoths are usually pictured in the snow because they have been found preserved in the far north. Yet the food in their mouths and stomachs has always been subtropical. This is because after the flood, with warm oceans and cold land, there was a one time ice age due to heavy snowfall that did not all melt. However, around the arctic ocean, the climate was warm — until the sea cooled and the mammoths were trapped in a winter storm.

So it should be no surprise that mammoth fossils are found in Texas. And, of course, they grow them big there! Asiel was found in the small town of Clute near Houston, Texas. Joe helped excavate it. A&M University did most of the work. A student found a wooden bowl at the site; a first. When cleaning and re-identifying the bones, Joe found two pieces of pottery; another first. There were Ice Age bones all around with signs that they were on the surface at least ten years.

Plus, the bones were 35 feet below the surface in sand and 15 feet below current sea level. On the right is one of the pottery pieces. It is jet black. Black clay comes from Mexico. It appears to have been used for a tool.
