The Cassini Legacy at Saturn. This image-rich program will share some of the major discoveries at the Saturn system, including the planet itself, its rings, moons, magnetic field, and the giant moon Titan. The Cassini mission tour (2004-2017) was the most ambitious and well-equipped outer-planet mission to date, sending to Earth a wealth of data and images, some of which is of interest to Biblical creationists concerning the age of the solar system. The speaker will also briefly discuss his persecution over sharing intelligent design with co-workers, and how it ended in a nationally-publicized court trial.

Sponsored by the TCCSA, Free and Open To The Public www.tccsa.tc
