Lobe-finned fish

Early amphibian

Certain aspects of evolution occasionally seem fairly plausible to many people ... even Christians. If we use our imagination, we can envision fish slowly turning into amphibians, with their fins gradually being transformed into legs and their lungs adapting to breathing air. However, when we take a closer look at what actually has to go on inside (in the DNA) we see a very different picture. It's like looking under the hood of a beautiful red sports car only to find that its engine is completely missing! Presenting some cutting-edge information about DNA, this presentation clearly demonstrates (in laymen's terms) that molecules-to-man evolution is virtually impossible.
